## Discounts

Other than figuring sales tax, the area of life in which you will probably most often need to use percentages is in calculating discounts.

A laptop that costs $\$ 600$ is $20 \%$ off. What is the sale price?
Method 1. We calculate $20 \%$ of $\$ 600$. That is the discounted amount in dollars.
Then we subtract that from the original price, $\$ 600$.
$20 \%$ of $\$ 600$ is $\$ 120$. And $\$ 600-\$ 120=\$ 480$. So, the sale price is $\$ 480$.
Method 2. Since $20 \%$ of the price has been removed, $80 \%$ of the price is left.
By calculating $80 \%$ of the original price, you will get the new discounted price: $0.8 \times \$ 600=\$ 480$

## Two methods for calculating the discounted price:

1. Calculate the discount amount as a percentage of the original price. Then subtract.
2. Find what percentage of the price is left. Then calculate that percentage of the normal price.
3. All of these items are on sale. Calculate the discount in dollars and the resulting sale price.

| Price: \$90 <br> a. $20 \%$ off | Price: \$5 <br> b. $40 \%$ off | Price: \$15 <br> c. $30 \%$ off |
| :---: | :---: | :---: |
| Discount amount: \$ 18 | Discount amount: \$ | Discount amount: \$ |
| Sale price: \$ | Sale price: \$ | Sale price: \$ |

2. A swimsuit that cost $\$ 25$ was on sale for $20 \%$ off.

Monica calculated the discounted price this way: $\$ 25-\$ 20=\$ 5$.
What went wrong? Find the correct discounted price.
3. All the items are on sale. Find the discounted price.

| a. Price: $\$ 1.20$ $25 \%$ off | b. Price: \$18 $25 \%$ off | c. Price: $\$ 150$ $30 \%$ off |
| :---: | :---: | :---: |
| Discount amount: \$ | Discount amount: \$ | Discount amount: \$ |
| Discounted price: \$ | Discounted price: \$ | Discounted price: \$ |
| d. Price: \$20 $40 \%$ off | e. Price: $\$ 2.20$ $10 \%$ off | f. Price: $\$ 1.30$ $50 \%$ off |
| Discount amount: \$ | Discount amount: \$ | Discount amount: \$ |
| Discounted price: \$ | Discounted price: \$ | Discounted price: \$ |
